ABSTRACT

Moveo is an enterprise-scale travel booking platform designed to provide a unified system for booking flights, hotels, and buses. Along with travel bookings, the platform allows users to **discover and book events at their destination** and provides **book-reading options** to make the overall travel experience more engaging. The platform follows a microservices and event-driven architecture, where different services independently manage authentication, inventory, search, bookings, payments, notifications, reviews, loyalty, recommendations, and administration. These services communicate through events, allowing multiple operations to be handled efficiently without depending heavily on one central component. The platform uses distributed system techniques to maintain data consistency, prevent duplicate transactions, and manage failures during booking and payment processes. It also supports containerized deployment, horizontal scaling, and continuous system monitoring. Overall, Moveo demonstrates how event-driven architecture and distributed systems can build a scalable, reliable, fault-tolerant, secure, and user-friendly travel platform.
